$$\int \cos^{-2}(2x)dx$$
$$= \int \sec^2(2x)dx$$
$$\text{Stel } u = 2x \Rightarrow \frac{1}{2}du = dx$$
$$= \int \sec^2(u) \cdot \frac{1}{2}du$$
$$= \frac{1}{2} \int \sec^2(u)du$$
$$= \frac{1}{2} \tan(u) + C$$
$$= \frac{1}{2} \tan(2x) + C$$
