$$f(x) = \ln \left(\tan \left(\frac{x}{2} \right) \right)$$

We leiden af met de kettingregel:

$$\begin{aligned} f'(x) &= \frac{\left(\tan \left(\frac{x}{2} \right) \right)'}{\tan \left(\frac{x}{2} \right)} \\ &= \frac{\frac{1}{2} \sec^2 \left(\frac{x}{2} \right)}{\tan \left(\frac{x}{2} \right)} \\ &= \frac{\sec^2 \left(\frac{x}{2} \right)}{2 \tan \left(\frac{x}{2} \right)} \end{aligned}$$

Nu schrijven we alles met sinus en cosinus:

$$\begin{aligned} &\frac{1}{\cos^2 \left(\frac{x}{2} \right)} \\ &= \frac{\sin \left(\frac{x}{2} \right)}{2 \frac{\sin \left(\frac{x}{2} \right)}{\cos \left(\frac{x}{2} \right)}} \\ &= \frac{1}{2 \sin \left(\frac{x}{2} \right) \cos \left(\frac{x}{2} \right)} \end{aligned}$$

Omdat:

$$\sin x = 2 \sin \left(\frac{x}{2} \right) \cos \left(\frac{x}{2} \right)$$

krijgen we:

$$f'(x) = \frac{1}{\sin x}$$
