$$A(z) = (z - a)(z - b)Q(z) + cz + d$$

$$\begin{cases} A(a) = ac + d = 0 \\ A(b) = bc + d \end{cases}$$

$$\Rightarrow \begin{cases} d = -ac \\ A(b) = bc - ac \end{cases}$$

$$\Rightarrow \begin{cases} d = -ac \\ A(b) = c(b - a) \end{cases}$$

$$\Rightarrow \begin{cases} c = \frac{A(b)}{b - a} \\ d = -\frac{aA(b)}{b - a} \end{cases}$$

$$\Rightarrow R(z) = \frac{A(b)}{b - a}(z - a)$$
