$$\begin{aligned}
 I &= \int \frac{2x+11}{x^2+6x+10} dx = 2 \int \frac{x}{x^2+6x+10} dx + 11 \int \frac{1}{(x+3)^2+1} dx \\
 &= 2 \int \left(\frac{2x+6}{2(x^2+6x+10)} - \frac{3}{x^2+6x+10} \right) dx + 11 \int \frac{1}{(x+3)^2+1} dx
 \end{aligned}$$

Stel: $t = x^2 + 6x + 10 \Rightarrow dt = 2x + 6dx$ en stel: $y = x + 3 \Rightarrow dy = dx$

$$\begin{aligned}
 &= 2 \left[\int \frac{1}{2(x^2+6x+10)} \cdot (2x+6dx) - \int \frac{3}{(x+3)^2+1} dx \right] + 11 \int \frac{1}{(x+3)^2+1} dx \\
 &= 2 \left[\int \frac{1}{2t} dt - \int \frac{3}{y^2+1} dy \right] + 11 \int \frac{1}{y^2+1} dy \\
 &= 2 \left[\frac{1}{2} \ln |t| + c - 3 \operatorname{Bgtan}(y) + c \right] + 11 \operatorname{Bgtan}(y) + c \\
 &= \ln |x^2 + 6x + 10| - 6 \operatorname{Bgtan}(x+3) + 11 \operatorname{Bgtan}(x+3) + c \\
 &= \ln |x^2 + 6x + 10| + 5 \operatorname{Bgtan}(x+3) + c
 \end{aligned}$$
