$$\sum_{n=0}^{\infty} n^2 e^{-n^3}$$

$\Rightarrow$ D'Alembert

$$\begin{aligned} & \lim_{n \rightarrow +\infty} \frac{(n+1)^2 e^{-(n+1)^3}}{n^2 e^{-n^3}} \\ &= \lim_{n \rightarrow +\infty} \frac{(n+1)^2 e^{(-n^3-3n^2-3n-1)}}{n^2 e^{-n^3}} \\ &= \lim_{n \rightarrow +\infty} \left(\left(1 + \frac{1}{n}\right)^2 \cdot e^{-3n^2-3n-1} \right) = 0 \Rightarrow \text{convergent} \end{aligned}$$
