$$\begin{aligned}
 & \frac{d}{dx} (\text{Bgsin}(2x^2 + 1)) \Rightarrow \text{dom } f = \{0\} \\
 &= \frac{d}{dg} (\text{Bgsin}(g)) \frac{d}{dx} (2x^2 + 1) \\
 &= \frac{1}{\sqrt{1-g^2}} 2 \cdot 2x \\
 &= \frac{1}{\sqrt{1-(2x^2+1)^2}} 2 * 2x \\
 &= \frac{2x}{|x| \sqrt{-x^2-1}} \Rightarrow \text{dom } f' = \emptyset
 \end{aligned}$$
