$$\begin{aligned} & \frac{d}{dx} \left(x^{\frac{1}{x}} \right) \\ &= \frac{d}{dx} \left(e^{\frac{1}{x} \cdot \ln(x)} \right) \\ &= e^{\frac{1}{x} \cdot \ln(x)} \left(\frac{1}{x^2} - \frac{\ln x}{x^2} \right) \\ &= x^{\frac{1}{x}-2} (1 - \ln x) \end{aligned}$$
