$$2i$$

$$= (x + yi)^2 = x^2 - y^2 + 2xyi$$

$$\begin{cases} x^2 - y^2 &= 0 \\ 2xy &= 2 \end{cases}$$

$$\Leftrightarrow \begin{cases} x^2 - y^2 &= 0 \\ x^2 \cdot (-y^2) &= -1 \end{cases}$$

$$\lambda^2 - 1 = 0$$

$$(\lambda - 1)(\lambda + 1) = 0$$

$$\lambda_1 = \frac{-b - \sqrt{D}}{2a} = 1$$

$$\lambda_2 = \frac{-b + \sqrt{D}}{2a} = -1$$

$$x^2 = 1$$

$$-y^2 = -1$$

$$x = \pm 1 \text{ en } y = \pm 1$$

$$\text{Oplossing: } 1 + i \text{ of } -1 - i$$
