$$(iz^2 + 2z + 5) \div (z - 1 + i)$$

stel $z - 1 + i = 0$, dan is $z = 1 - i$

Horner:

$$\begin{array}{r|rr|r} 1-i & i & 2 & 5 \\ & | & 1+i & 4-2i \\ \hline & i & 3+i & 9-2i \end{array}$$

Resultaat:

$$\begin{aligned} A(z) &= B(z) \cdot Q(z) + R(z) \\ A(z) &= (z - 1 + i) \cdot (iz + 3 + i) + (9 - 2i) \end{aligned}$$
