$$\begin{aligned}f(x) &= \frac{ax^2 + bx + c}{2x} \\f'(x) &= \frac{(2ax + b) \cdot 2x - (ax^2 + bx + c) \cdot 2}{(2x)^2} \\&= \frac{4ax^2 + 2bx - 2ax^2 - 2bx - 2c}{4x^2} \\&= \frac{2ax^2 - 2c}{4x^2} \\&= \frac{ax^2 - c}{2x^2}\end{aligned}$$
