$$\begin{aligned}f(x) &= \frac{x-4}{x+2} \\f'(x) &= \frac{(x+2) \cdot 1 - (x-4) \cdot 1}{(x+2)^2} \\&\Rightarrow f'(x) = \frac{x+2-x+4}{(x+2)^2} \\&\Rightarrow f'(x) = \frac{6}{(x+2)^2}\end{aligned}$$
