$$\begin{aligned} & \int \frac{2x^2 - x + 2}{2x - 3} dx \\ &= \int \left(x + 1 + \frac{5}{2x - 3} \right) dx \\ &= \frac{x^2}{2} + x + \int \left(\frac{5}{2x - 3} \right) dx \end{aligned}$$

stel $u = 2x - 3$

$$\begin{aligned} du &= 2dx \\ &= \frac{x^2}{2} + x + \frac{5}{2} \int \frac{du}{u} \\ &= \frac{x^2}{2} + x + \frac{5}{2} \ln |u| \\ &= \frac{x^2}{2} + x + \frac{5}{2} \ln |2x - 3| + C \end{aligned}$$
