$$I = \int_0^{\frac{\pi}{2}} \cos^3 x dx$$

Eerst vinden we de onbepaalde integraal

$$\int \cos x \cos^2 x dx = \int \cos x (1 - \sin^2 x) dx$$

Stel $u = \sin x$

$$du = \cos x dx$$

$$\begin{aligned} & \int (1 - u^2) du \\ &= u \left(1 - \frac{u^2}{3} \right) + C \end{aligned}$$

Pas grenzen aan en vul in

$$\begin{aligned} I &= \left[u \left(1 - \frac{u^2}{3} \right) \right]_0^1 \\ I &= \frac{2}{3} \end{aligned}$$
