$$\begin{aligned}f(x, y) &= \sqrt{50 - x^2 - y^2} \text{ en } \mathbf{a} = (4, -3) \\z &= f(\mathbf{a}) + \frac{\partial f}{\partial x}(\mathbf{a})(x - a) + \frac{\partial f}{\partial y}(\mathbf{a})(y - b) \\&= 5 - \frac{4}{5}(x - 4) + \frac{3}{5}(y + 3) \\&= -\frac{4x}{5} + \frac{3y}{5} + 10\end{aligned}$$
